

Now discover the versatile and dependable features of ICONNECT3.0 - features which you won't find in any other professional software for measurement and testing.

ICONNECT 3.0 is

■ Simple

An integrated, graphical debugger (breakpoints, single-step mode, watch window, etc.) increases productivity. The improved Help system (HTML, German/English) makes working with ICONNECT easier than ever before.

■ Fast

Data (integer and floating point arrays) are processed faster. A two-stage driver buffer for data acquisition, a polling mode for fast controllers and an efficient visual display improve quality. All dialog (operating) and visual display elements are decoupled from the sequence thread control, so that real-time processing is possible. The data flow graph is optimized by a profiler, accurate to the microsecond.

■ Clear

Version 3 enables the combining of a number of lines (within one signal graph or beyond macro limits) to form buses. Multi-channel modules and expanded module functions give you more control over the application.

■ Extensive

ICONNECT has over 60 new modules available, e.g., from the groups Image Processing, Neural Networks, Fuzzy Systems, JTFA, Display, Internet, Network. All modules are now included in the standard distribution.

■ **Reliable**

Key combinations critical to the system can be deactivated (e.g., Ctrl-Alt-Del, Alt-Tab, Ctrl-Esc).

■ **Convenient**

Version 3 is impressive due to its improved performance as the result of expanded editing functions in the Input and Display Managers (multiple selection). A number of printers can be supported simultaneously.

■ **Communicative**

ICONNECT communicates optimally with the various network and Internet protocols (HTTP server, TCP/IP server/client, UDP, TFTP server).
